

The **n-queens** puzzle is the problem of placing  $n$  queens on an  $n \times n$  chessboard such that no two queens attack each other.

Given an integer  $n$ , return *all distinct solutions to the n-queens puzzle*.

Each solution contains a distinct board configuration of the n-queens' placement, where 'Q' and '.' both indicate a queen and an empty space, respectively.

Example 1:

Input:  $n = 4$

Output: `[[".Q..", "...Q", "Q...", "..Q."], ["..Q.", "Q...", "...Q", ".Q.."]]`

Explanation: There exist two distinct solutions to the 4-queens puzzle as shown above

Example 2:

Input:  $n = 1$

Output: `[["Q"]]`

Constraints:

- $1 \leq n \leq 9$

```
Def back-track (...):  
    stop check  
    for choice in choice_list:  
        do choice  
        back-track(...)  
        redo choice
```

Time Complexity:  $O(n^2)$   
Space Complexity:  $O(n)$

```
